## XLerator Electric Hand Dryer

By using a powerful blast of air to blow off water droplets, the XLerator electric hand dryer uses about one-third as much energy and one-third as much time to dry hands (12-15 seconds) as conventional electric hand dryers. The XLerator also draws 1,500 watts instead of the usual 2,200, making it easier to install in older buildings and contributing to its energy efficiency. EBN estimates that the energy used by the XLerator is significantly less than the energy required to manufacture a typical paper towel. Xlerator is available in all voltages; 110/120V, 208V, 220-240V, and 277V. A recessed ADA 4" protrusion Xlerator will be added to the model line in late 2003.

### Contact information
